

QQboxx : What should I do if the driver cannot be installed properly?

Recommendation:

If the computer does not automaticall prompt for device driver installation, reinstall the driver manually by:

- Power on the auto-loader; plug it to the host computer.
- If the computer did not show the driver installing window, right click on "My Computer" and choose "Properties".
- In System Properties window, click Device Manager > Hardware
- In "Device Manager" window, there may be un-recognized device listed with a "!" icon. Right click the device, click on "Properties".
- Choose "Reinstall Drivers" to reinstall device driver. It shall need the driver on a CD or an accessible path (such as hard disk).

It is recommended to always update the host computer to the latest version of motherboard firmware and Windows Operating System.
